PROFESSIONAL SUMMARY

B.Tech (IT-IoT) pre-final year student with hands-on experience building full-stack web applications using React, Next.js, Node.js, TypeScript, and MongoDB/PostgreSQL. Working knowledge of JWT-based authentication, real-time systems (Socket.io), and AI/ML integration (TensorFlow, scikit-learn, CNNs) — seeking to contribute to production-grade software.

SKILLS

Programming Languages: C/C++, JavaScript, Python, Java

Frontend: React.js, Next.js, Tailwind CSS, GSAP, Framer Motion, Responsive Design, REST API Integration

Backend & APIs: Node.js, Express.js, RESTful APIs, JWT, Bcrypt, Multer, Cloudinary

Database : MySQL, PostgreSQL, MongoDB, schema design

Tools & Core CS: Git, GitHub, VS code, Linux, DSA, OOPs, Time & Space Complexity

PROJECTS

StayZ [Github[?]] [Live Link[?]]

June 2026 – Present

- Shipped 23 RESTful API endpoints across listings, bookings, reviews, saves, and auth on a Next.js 16 App Router + Prisma + PostgreSQL stack, covering the full owner-to-renter flow from listing creation to booking approval.
- Prevented registration abuse by writing an in-memory IP rate limiter (5 requests/hour default, auto-evicting expired entries every 5 minutes) on auth endpoints, with a documented upgrade path to Redis for distributed deployments.
- Modelled a 15-table relational schema in Prisma (Listings, Bookings, Reviews, Saved Listings, Amenities, etc.) with selective field projection on list queries to keep card-view payloads lean instead of over-fetching full listing objects.

DraftSpace [Github[?]] [Live Link[?]]

Apr 2026 – May 2026

- Built an AI-powered collaborative whiteboard using Next.js 14, Socket.io, and MongoDB, with Claude and Gemini embedded directly on a live Excalidraw canvas for inline text, code, and image generation.
- Cut socket traffic by ~95% with 80ms event throttling on a custom Node.js + Socket.io real-time sync layer.
- Deployed on Render with Google OAuth, per-IP rate limiting on AI routes, and auto-save.

Ikigai4teens [Github[?]] [Live Link[?]]

Sept 2025 – Dec 2025

- Built a MERN app where teens answer a 4-part questionnaire and get their Ikigai mapped out in a live SVG diagram — no page reload, results update as they go.
- Hooked up an AI API to generate career suggestions in 3 categories. Teens get a personalized output in seconds instead of digging through career sites for hours — roughly 70% less lookup time per session.
- Set up Express.js RESTful routes with MongoDB persistence so users can leave and come back mid-questionnaire without losing progress.

EDUCATION

Madhav Institute of Technology and Science

Bachelor of Technology – IT-IoT

CGPA – 8.17 / 10 (as of 6th Semester)

Gwalior, Madhya Pradesh

Expected: Jun 2027

Senior Secondary Certificate (12th CBSE)

Diploma in Computer Science

Percentage – 89%

Shivpuri, Madhya Pradesh

Completed: 2023

CERTIFICATIONS & TRAININGS

- Solution Architecture job Simulation – AWS (2025)** : Designed a scalable AWS architecture (EC2, S3, VPC, Auto Scaling) to handle ~3× traffic growth using a multi-tier setup. Applied AWS Well-Architected Framework principles (reliability, security), incorporating fault tolerance and high availability.
- Deep Learning Fundamentals – Nvidia (2024)** : Trained CNNs for image classification on GPU; applied hyperparameter tuning and neural network design — directly fed into AI integration work on Ikigai4teens.
